

**Supplementary Figure 1.** Plating efficiency for monolayer- and spheroids-derived cells.

Bar graph represents the plating efficiency mean calculated by counting the number of colonies formed in a given well and dividing by the total number of cells seeded in the well, represented as a percentage. Error bars represent standard deviation (SD) ( $n = 3$ ); \*  $p < 0.05$  and \*\*  $p < 0.005$ .
